Montana DPHHS – Tuberculosis Program

Long-term Care - TB Risk Assessment

Long-term Care, Residential Treatment, ESRD (outpatient), Hospice (inpatient)

Today's Date				
Facility				
Address				
PhoneCounty				
Completed byTitle				
PART A - INCIDENCE OF TB				
 Number of TB cases identified in your facility in the last year? Number of TB cases identified in your county in the last year? Obtain information from local health department or state website: http://tb.mt.gov Comments: 				
PART B - RISK CLASSIFICATION – check category that applies				
LOW RISK No TB cases < 200 beds & < 3TB patients with active TB per year ≥ 200 beds & < 6TB patients with active TB per year				
MEDIUM RISK $ = < 200 \text{ beds } \& ≥ 3 \text{ patients with active TB per year} $ = ≥ 200 beds & ≥ 6 patients with active TB per year				
POTENTIAL ONGOING TRANSMISSION Evidence of ongoing <i>M. tuberculosis</i> transmission				
PART C - CONSIDERATIONS TO DETERMINE IF HIGHER RISK CLASSIFICATION IS NEEDED FOR YOUR FACILITY – The risk classification for your facility may be adjusted to a higher level of risk based on the answers to these questions. For more information call you local health department.				
 Is there a relatively high prevalence of TB disease in the community/communities your facility serves? Is there evidence of recent TB transmission in your facility? Is there a high prevalence of immunosuppressed patients or HCWs in your facility? In the last year, has your facility had any patients/employees with drug-resistant TB? 				
Comments:				

PART D - TUBERCULIN SKIN TESTING - TST

1.	•		ealth care workers (HCWs) and resident/admits?			
2.	2. Are the TST records for HCWs maintained and where?					
	Who maintains these records? List the TST conversion rate for: (number of positive TSTs divided by number tested)					
7.	List the TST conversion rate for: (number of positive TSTs divided by number tested)					
	• last year					
	• 2 years					
I	PART E - TB INFECTION CONTROL PLAN					
	 Does your facility have a TB Infection Control Plan for confirmed or suspected TB cases? How are confirmed or suspected TB cases isolated? 					
2. 3.	_					
	1					
	1 1					
	. Does the TB Infection Control Plan need to be updated? Is there an Infection Control Committee for your facility?					
0.	is there are infection Control C	commutee for y	your racinty:			
7	Check the groups that are rep	recented on the	Infection Control Committee			
7.	Physicians	resented on the	Administrators			
			Housekeeping			
	Registered Nurses		1 0			
	Employee Health		Safety			
	Other					
PART F - RESPIRATORY ISOLATION ROOM						
1.	. Does your facility have an AFB isolation room? If NO, complete Section G and Date of Next					
2	TB Risk Assessment below only.					
۷.	. What does your facility do with patients on respiratory isolation?					
3.	. How is the isolation room ventilated?					
٥.						
	local exhaust ventilation (enclosing devises, exterior devices)					
	general ventilation (e.g. single-pass system, recirculation system) air-cleaning methods (e.g. HEPA filtration, UVGI)					
		` U	,			
1	airborne infection isolation rooms (AII) (e.g. negative pressure rooms)					
4.	4. What are the actual Air Changes per Hour (ACH) and design for the isolation rooms?					
Ro	om	ACH	Design			
110		11011	Design			

PART G - IMPLEMENTATION OF TB INFECTION CONTROL PLAN 1. Who is responsible for the implementation of the TB Infection Control Plan?_____ 2. Does the TB Infection Control Plan ensure prompt detection, airborne infection isolation, transfer and treatment of potentially infectious TB patients? ____ 3. Is the TB Infection Control Plan being properly implemented? _____ 4. List ongoing infection control training and education available to your facility's HCWs. Comments: PART H - PERSONAL RESPIRATORY PROTECTION PROGRAM 1. Does your facility have a personal respiratory protection program? 2. Which HCWs are included in the personal respiratory protection program? ___ Physicians ___ Mid-level practitioners (NP, PA) ___ Nurses ___ Respiratory Therapists ___ Administrators ___ Janitorial staff ___ Transportation staff ___ Dietary workers ___ Housekeeping ___ Others _____ 3. What types of respirators are used in your facility? Include manufacturer, model, and specific application. (e.g. ABC model 1234 for bronchoscopy, DEF model ZN95 for all HCWs working with TB patients) 4. Is there annual respiratory protection training for HCWs? _____ 5. Is there initial fit testing for HCWs? _____ 6. Is there periodic fit testing for HCWs? ____ When ____ 7. Describe the method of fit testing used: _____ Comments: Date of next TB Risk Assessment

TB Screening Based on Risk

Long-term Care, Residential Treatment, ESRD (outpatient) & Hospice (inpatient)

Low-Risk Setting

< 200 beds & < 3TB cases/year > 200 beds & < 6TB cases/year

No other risk factors (See PART C)

Low-Risk TB Screening

- -2-step TST on hire or admit to all listed sites if >18 yr 1-step TST if ≤18 yrs
- Medical evaluation, including symptom assessment & chest x-ray if TST positive or symptomatic
- Evaluate for treatment of Latent TB Infection if active TB disease is ruled out
- No annual TST
- Annual symptom assessment if TST positive, Latent TB Infection or prior Active TB Disease
- TST if unprotected exposure occurs

Medium-Risk Setting

<200 beds & \geq 3TB cases/year \geq 200 beds & \geq 6TB cases/year

Medium-Risk TB Screening

- 2-step TST on hire or admit to all listed sites if >18yr one TST if ≤18 yrs
- Medical evaluation, including symptom assessment & chest x-ray if TST positive or symptomatic
- Evaluate for treatment of Latent TB Infection if active TB disease is ruled out
- Annual TST and symptom assessment
- TST for unprotected exposure

Potential Ongoing Transmission Setting

Potential Ongoing Transmission Screening

Report to local health department ASAP

Report to local health department ASAP

Indications for Two-Step Tuberculin Skin Testing (TST)

Employee & Patient TST Situation	Recommended TST
1. No previous TST result	1. Two-step baseline TST if >18 years old (see #4 if ≤18 yrs)
2. Previous negative TST result >12 months before new employment	2. Two-step baseline TST
3. Previous documented negative TST result ≤12 months before employment	3. Single TST needed for baseline testing; this will be the second-step
4. ≥2 previous documented negative TSTs and most recent TST >12 months before employment; resident/employee ≤18 years old	4. Single TST; two-step is not necessary
5. Previous documented positive TST result	5. No TST; need TB symptom screen and baseline X-ray
6. Previous undocumented positive TST result	6. Two-step baseline TST
7. Previous BCG vaccination – BCG effect on TST results usually wanes after 5 years	7. Two-step baseline TST

Definitions:

<u>Health-care Workers (HCWs)</u> – HCWs include all paid and unpaid persons working in health-care settings.

On Hire – The administration and reading of the first step of the employee's TST should be completed prior to beginning work. The second TST (if applicable) should be placed 1-3 weeks after the first TST. Regardless of the initial TST result, no employee should be allowed to begin work if he/she has <u>symptoms of active pulmonary TB</u> until a complete TB medical evaluation has been completed and TB has been ruled out. If an employee has LTBI and adequate treatment is not documented, complete a medical evaluation to rule out active TB, offer treatment for LTBI if not medically contraindicated and conduct an annual symptom assessment. If a potential employee has documentation of previous, cured active TB, conduct an annual symptom assessment.

On Admit to Long-term Care, Residential Treatment, ESRD, In-patient Hospice – The administration and reading of the resident's first TST should be completed prior to admission. If the TST is negative and the resident is asymptomatic for TB, the resident can be admitted pending the second TST result (if applicable). Regardless of the TST result, if the potential resident has <u>symptoms consistent with TB</u> the potential resident should not be admitted until a complete <u>medical evaluation for TB</u> has been completed, including the collection of sputum specimens for bacteriological examination, and TB has been ruled out. If the TST is positive, the potential resident should not be admitted until a thorough <u>medical evaluation for TB</u> has been completed.

Residents with a positive TST who have had active disease ruled out should be considered for treatment of Latent TB Infection (LTBI). If treatment of LTBI is not completed, staff should be made aware of the resident's TST and the resident should be monitored for development of symptoms of infectious TB.

<u>TB Medical Evaluation</u> – The purpose of the exam is to diagnose TB disease or LTBI, and to select treatment. A medical evaluation includes a medical history, a TB symptom screen, clinical or physical exam, and diagnostic tests as appropriate (e.g. TST, chest x-ray, bacteriological exams, and HIV testing).

<u>Annual Symptom Assessment</u> – Complete this form for the following residents/employees who initially have had Active TB Disease ruled out:

- 1. Residents/employees with Latent TB Infection (documented positive tuberculin skin test) with or without documented therapy for LTBI
- 2. Residents/employees with prior Active TB Disease who have completed therapy

<u>Chest X-ray</u> – Employees/residents with a positive TST who have a normal chest x-ray should not have repeat chest x-rays performed routinely. Repeat x-rays are not needed unless TB signs or symptoms develop or a clinician recommends a repeat x-ray on a case-by-case basis. Employees/residents who have Latent TB Infection (LTBI) or cured TB disease should be evaluated annually with a symptom assessment and educated about TB signs and symptoms and the need to report such symptoms if present.

Definition of Active TB Disease vs. Latent TB Infection (LTBI):

TB Disease	Latent TB Infection (LTBI)
Symptoms – cough ≥ 2-3 weeks with or without sputum production that may be bloody; chest pain; chills; fever; night sweats; loss of appetite; unexplained weight loss; weakness or easy fatigability; malaise	No symptoms Do not feel sick
Can spread TB to others	Cannot spread TB to others
Usually have a positive TST Chest X-ray usually abnormal	Usually have a positive TST Chest X-ray normal
Report suspect or confirmed TB to local health department immediately	Not reportable to local health department
