

## Fall risk among adults\* with and without diabetes, Montana

\* Aged 45 years and older

I =95% Confidence Interval

Data source: Behavioral Risk Factor Surveillance System, Montana, 2012

- Adults with diabetes experienced a fall in the previous year more frequently than adults without diabetes.
- Of those that fell, more people with diabetes reported experiencing an injury during the fall than those without diabetes. Nearly half (45.5%) of adults with diabetes reported they were injured in the fall. About one third (32.9%) of adults without diabetes were injured in a fall.
