

Interim Analysis of COVID-19 cases in Montana (as of 10/2/2020)

This report is an interim epidemiological review of COVID-19 cases in Montana. Data is analyzed based on information available as of October 2, 2020. Current case count at the time of analysis is:

Case Count = 14,337

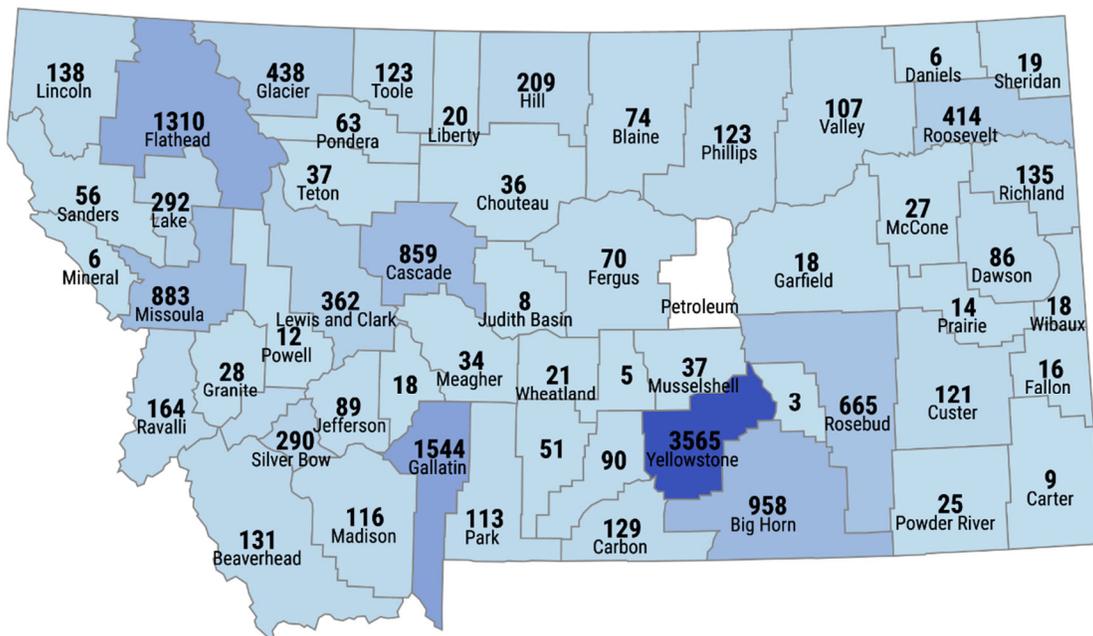

This report is completed using data that is available during the time of analysis and there may be a delay between current case count and this report, due to rapidly changing updates. When data is limited to available information, number of cases included in analysis is indicated in graphs.

Geographic Distribution

There are 14,337 cases of COVID-19 reported in 55 counties in Montana. Most cases are reported in more populous counties. Yellowstone County and Gallatin County have been the most impacted, reporting 25% and 11% of all reported cases, respectively. Flathead (9%), Big Horn (7%), Missoula (6%), Cascade (6%), and Rosebud (5%) and counties report more than 600 cases each (Figure 1).

*Figure 1: Map of Reported Montana COVID-19 cases**

Reported COVID-19 Cases in Montana as of 10/2/2020

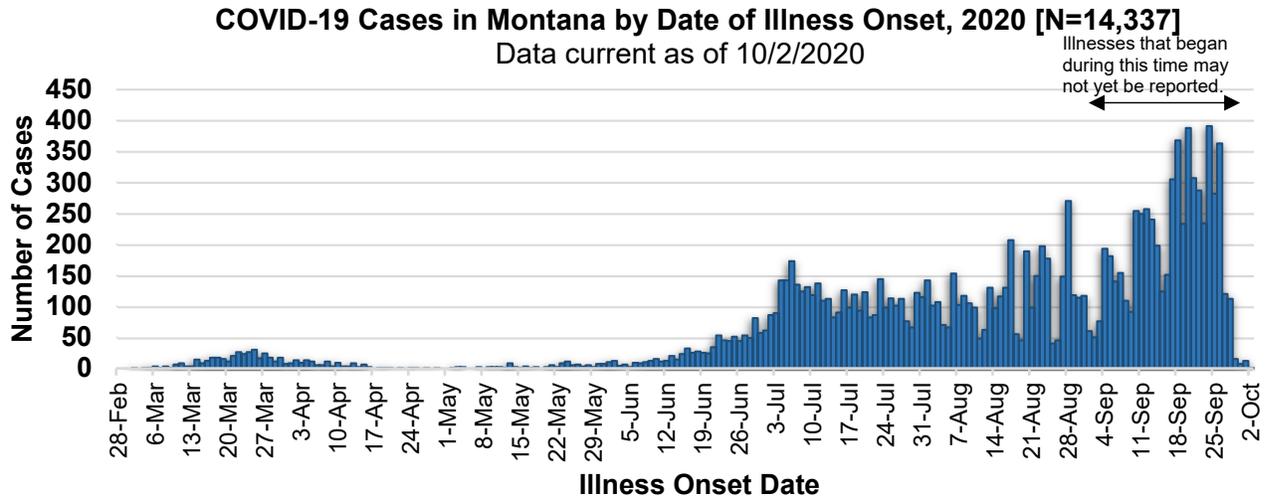

**Cases reported on the map initially included residents of other states who were tested and isolated in Montana. As COVID-19 is now widespread across the United States, the map no longer includes out of state residents who test positive in Montana in order to align with CSTE residency guidelines that classify cases by the individual's state of residence. This is standard practice for all communicable diseases to ensure accurate data for Montana.*

Epidemiological Data

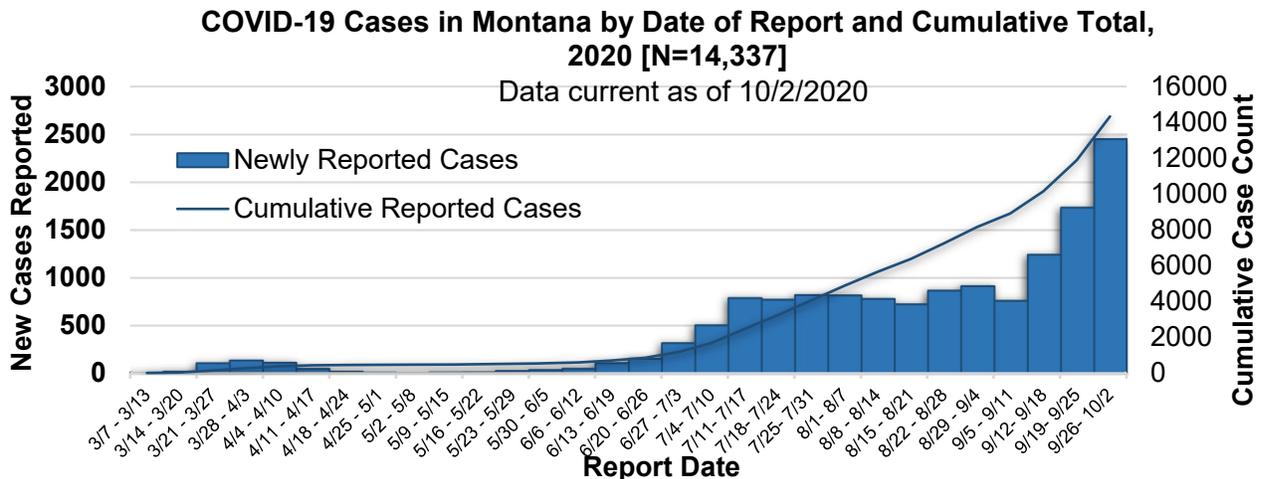

A total of 14,337 cases were reported as of 10/2/2020. Illness onset date is available for less than one third (32%) of reported cases. When onset date is not available, collection date is used to calculate an estimated onset date (Figure 2). Of note, about 439 (3%) of persons indicated that they were asymptomatic at the time of the test, meaning they showed no symptoms of COVID-19 at that time. Illness onsets that occurred within the past 10 days may not yet be reported due to lag time between illness onset, seeking healthcare for testing, and receiving test results.

Figure 2: Epi Curve for Montana COVID-19 cases

The first COVID-19 case in Montana was reported on 3/11/2020. Since then, the number of cases in Montana has climbed to 14,337 (Figure 3). Growth was initially exponential until reaching about 100 case reports, then growth became linear. By mid-April, growth significantly slowed and there were few new reported cases in May. Once 500 cases were reached in early June, case reports have grown exponentially again, then maintained linear growth in mid-July through August and developed exponential growth in September. Of note, updated CDC contact tracing recommendations on May 29, 2020 may contribute to increased case reports as all contacts to a case are recommended to be tested.

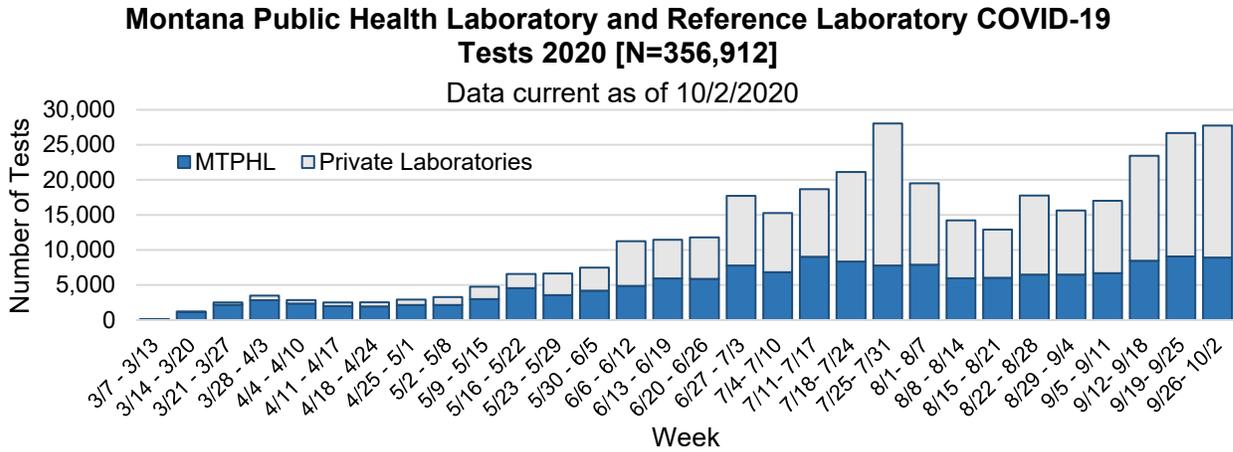

Figure 3: Cumulative reported cases for COVID-19 in Montana

Laboratory Data

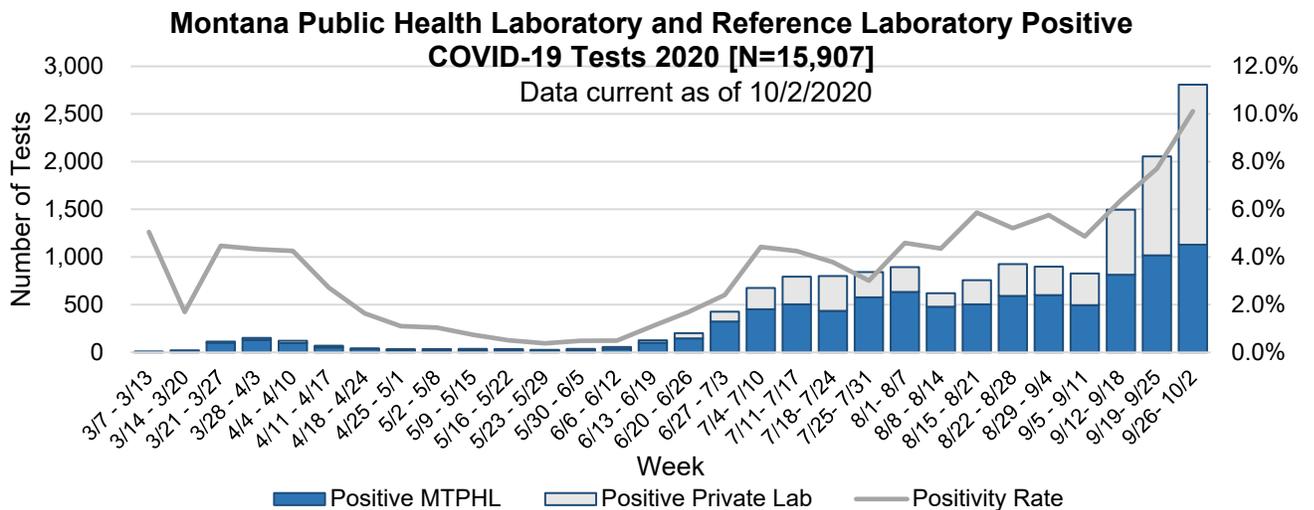

COVID-19 testing was initially available solely through the CDC. COVID-19 PCR testing capability was implemented by the Montana Public Health Laboratory (MTPHL) on March 9th. Private laboratories began implementing COVID-19 testing in the weeks following. Private laboratories include reference laboratories and those in smaller hospital labs performing point-of-care (POC) testing. A total of 356,912 tests have been completed to date. In September, an average of 24,000 tests were completed weekly, which is up by 50% of the number of specimens tested weekly in August (Figure 4).

Figure 4: Total Laboratory Testing for COVID-19 in Montana

So far 15,907 positive tests have been resulted through MTPHL and private laboratories. Some of these tests are repeat specimens from the same individual to check for clearance of the virus, but positive cases are only counted once. The overall positivity rate for all laboratory testing to date is about 3.5%, though this has varied over time. During the first peak in late March and early April, the weekly positivity reached over 4% and has dropped down to a low of 0.4% in May. In June, the average weekly positivity began to rise, reaching an average of 4-5% in July and August. The current weekly average in September is 8% and has surpassed 10% during the most recent week (Figure 5).

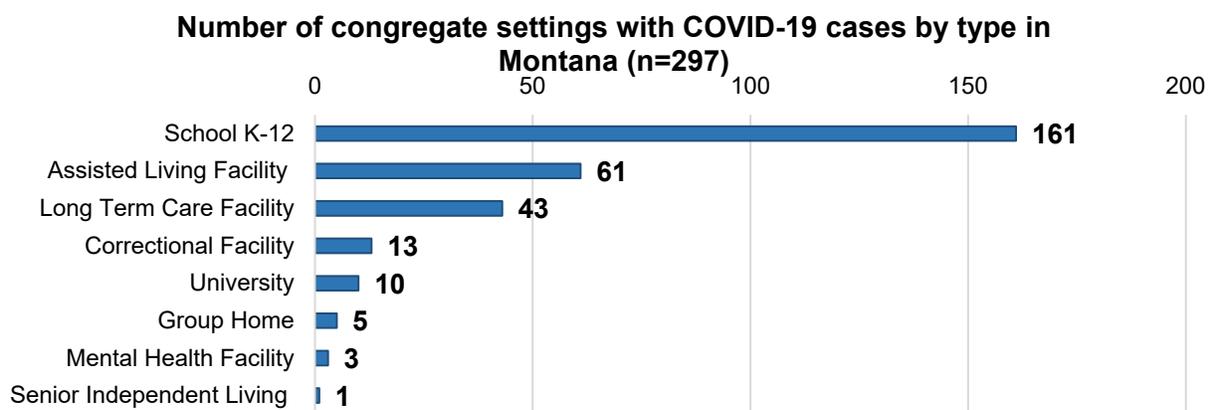

Figure 5: Positive Laboratory Tests for COVID-19 in Montana

Congregate Settings

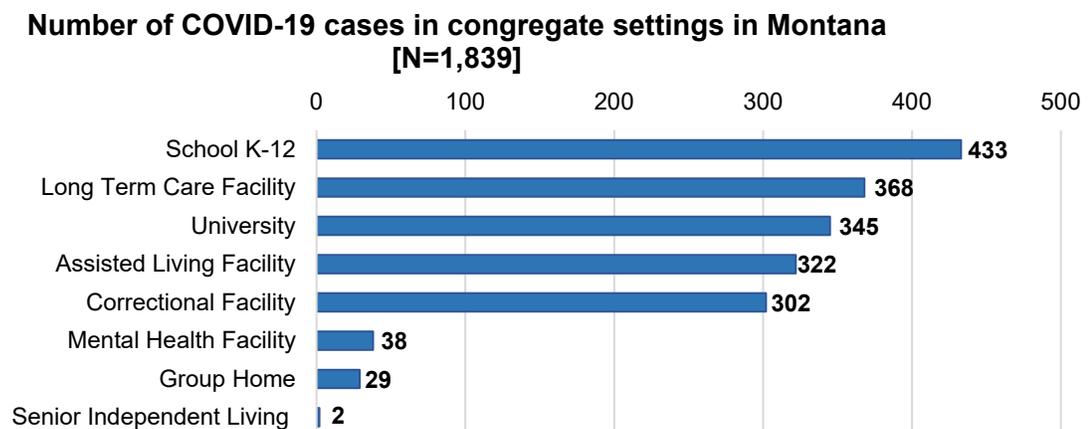

A congregate setting is an environment where a number of people reside, meet or gather in close proximity for either a limited or extended period of time. Examples of congregate settings include homeless shelters, group homes, prisons, detention centers, schools and workplaces. There are 28 counties that have reported at least one congregate setting with a COVID-19 outbreak in Montana. The counties with the most outbreaks in congregate settings are Yellowstone (31%), Flathead (12%), Gallatin (9%) and Cascade (8%) and Most outbreaks occur in schools, assisted living facilities (ALF) and long-term care facilities (LTCF), but outbreaks in other settings, such as correctional facilities, group homes and mental health facilities have also been reported (Figure 8). There are currently 220 active outbreaks in the state.

Figure 8: Type and number of congregate settings experiencing a COVID-19 outbreak in Montana

A total of 1,839 cases can be attributed to outbreaks at congregate setting, most of them are residents, meaning people who reside at these locations (i.e. residents, inmates, students) versus staff, who frequent these settings as employees (i.e. nursing staff, jailors, teachers) (Figure 9). Fifty-eight persons with COVID-19 have died as part of outbreaks associated with congregate settings, about one third of all COVID-19 reported deaths in the state. Most of those deaths (93%) occurred at ALFs and LTCFs.

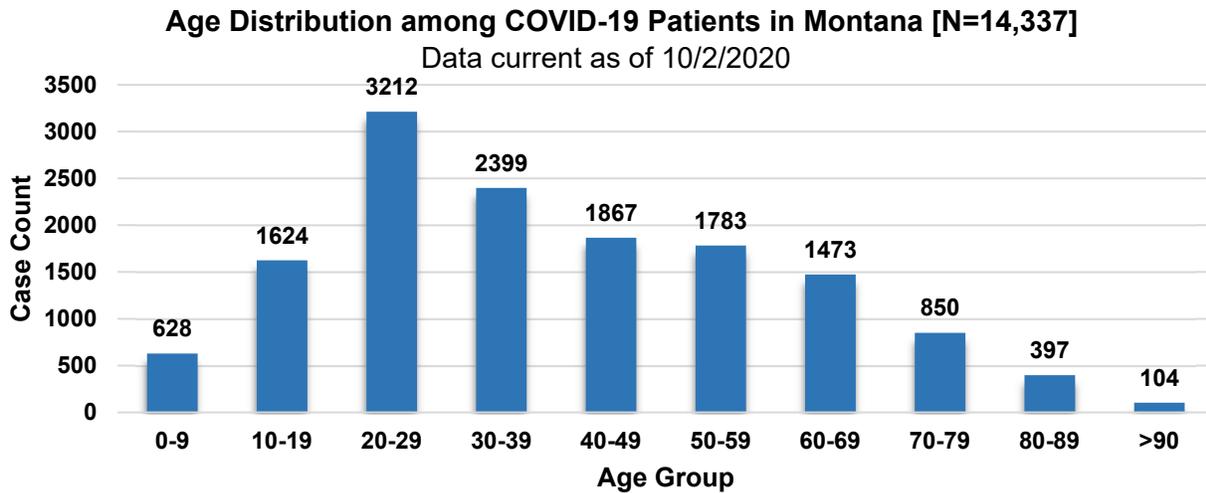

Figure 9: Number of COVID-19 residents and staff by type of congregate setting in Montana

Age and Demographic Distribution

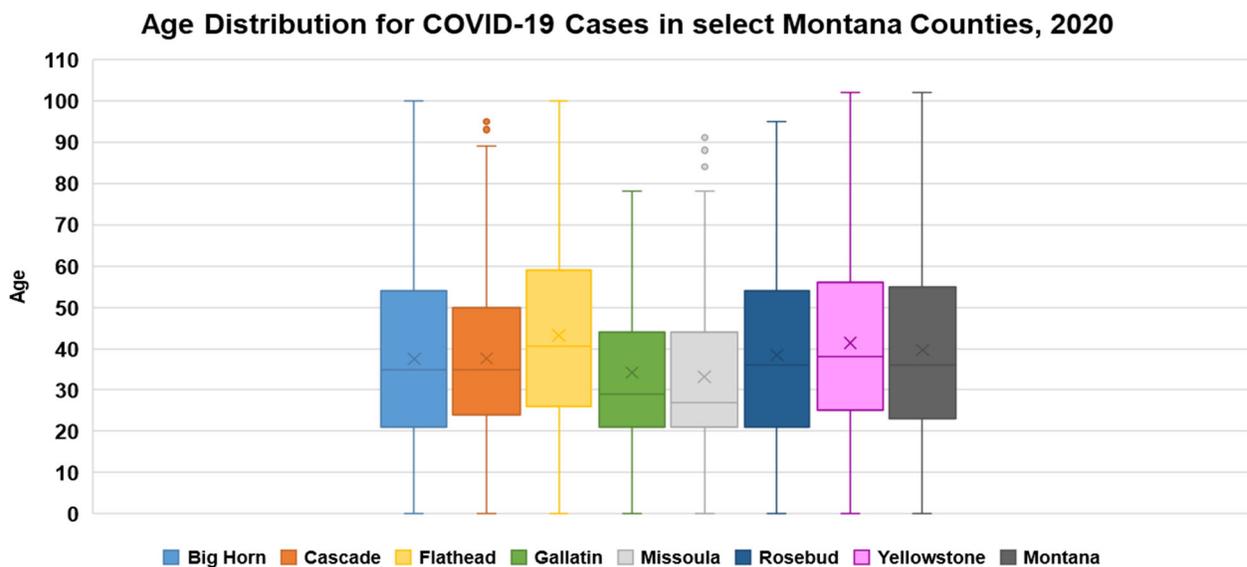

To date, persons between 20-29 years of age account for 22% of all reported COVID-19 cases in Montana. The next most common age group is 30-39 years (17%), followed by 40-49 (13%) and 50-59 years (12%) (Figure 10). The median age for all cases is 36 years of age (range: <1-102 years). Fifty percent of cases are between 23-55 years of age.

Figure 10: Age Distribution for COVID-19 cases in Montana

In the eight counties with more than 600 reported cases, the age distribution shows some slight variations. Most of these counties report ages comparable to the state average, with median ages somewhat comparable to each other. Reported cases in Gallatin and Missoula Counties tend to be younger than cases in other counties. Gallatin and Missoula counties report a lower median age of 29 and 27 years old, respectively (Figure 11).

Figure 11: Age Distribution for COVID-19 cases in select Montana Counties

Persons infected with COVID-19 are equally distributed among men and women, with 51% of cases reported as female and 49% reported as male. Of 9,120 (64%) cases with known race at the time of report, 72% of persons identify as white and 25% as American Indian, Alaska Native, Native Hawaiian, or Pacific Islander. Other races, comprising less than 3% of the cases, identify as African American, Asian or other race (Table 1). Ninety-five percent of all cases with ethnicity information available, identify as non-Hispanic and five percent as Hispanic. Native Americans make up about 7% of Montana’s population, but represent 25% of reported COVID-19 cases in the state.

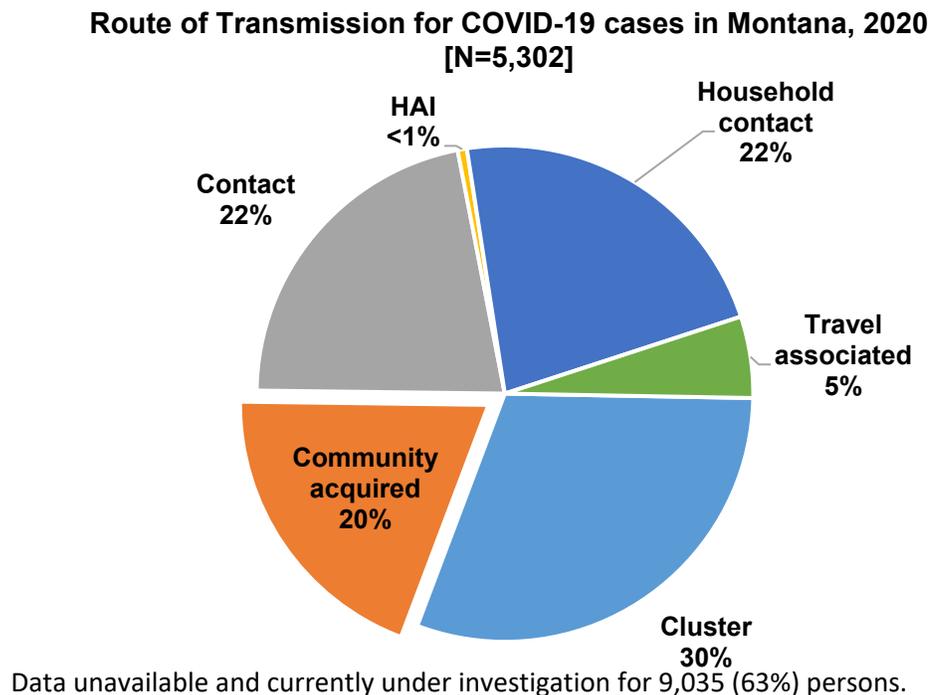

Table 1: Race of COVID-19 Cases in Montana (n=9,120)

Race	Count	Percent
White	6,561	72%
American Indian, Alaska Native, Native Hawaiian, Pacific Islander	2,286	25%
Black or African American	75	0.8%
Asian	44	0.5%
Other	154	1.7%
TOTAL	9,120	

Transmission Characteristics

There are 55 counties reporting COVID-19 cases and even though 36 of those counties indicate that at least one person acquired the virus in the community, 14 counties have reported widespread community acquired transmission occurring in their county. Of current data available, about 44% of cases were contacts to a known case, either within the household or otherwise. Clusters identified 30% of new case reports, and 20% of all cases with known transmission information likely acquired the virus in the community; most of those are in Gallatin and Yellowstone counties. Five percent of reported cases likely acquired the virus through travel-related exposures (Figure 12).

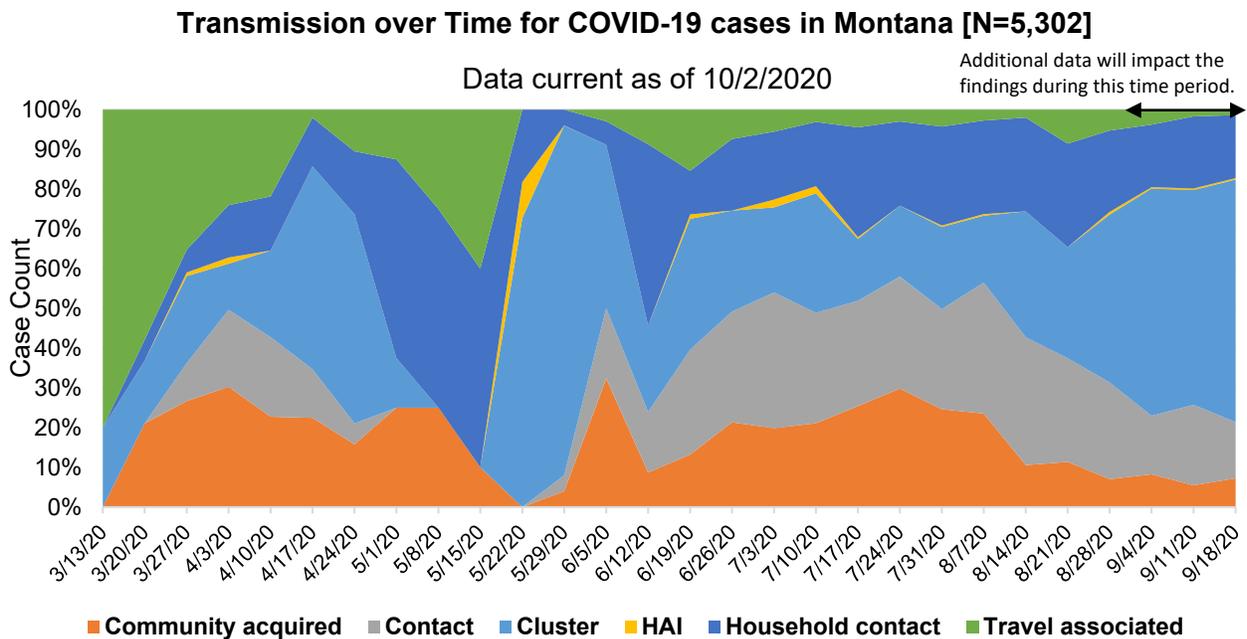

Figure 12: Known Routes of Transmission for Montana COVID-19

CATEGORY	DEFINITION
TRAVEL ASSOCIATED	Case traveled out-of-state during the incubation period
COMMUNITY ACQUIRED	Case was unable to be linked with other known cases
CONTACT	Contact to a case not in their household and not part of a known cluster
HOUSEHOLD CONTACT	Household contact to a confirmed case
CLUSTER	Case is part of a known cluster
HAI	Healthcare-associated infection
UNDER INVESTIGATION	Likely route of transmission is still under investigation

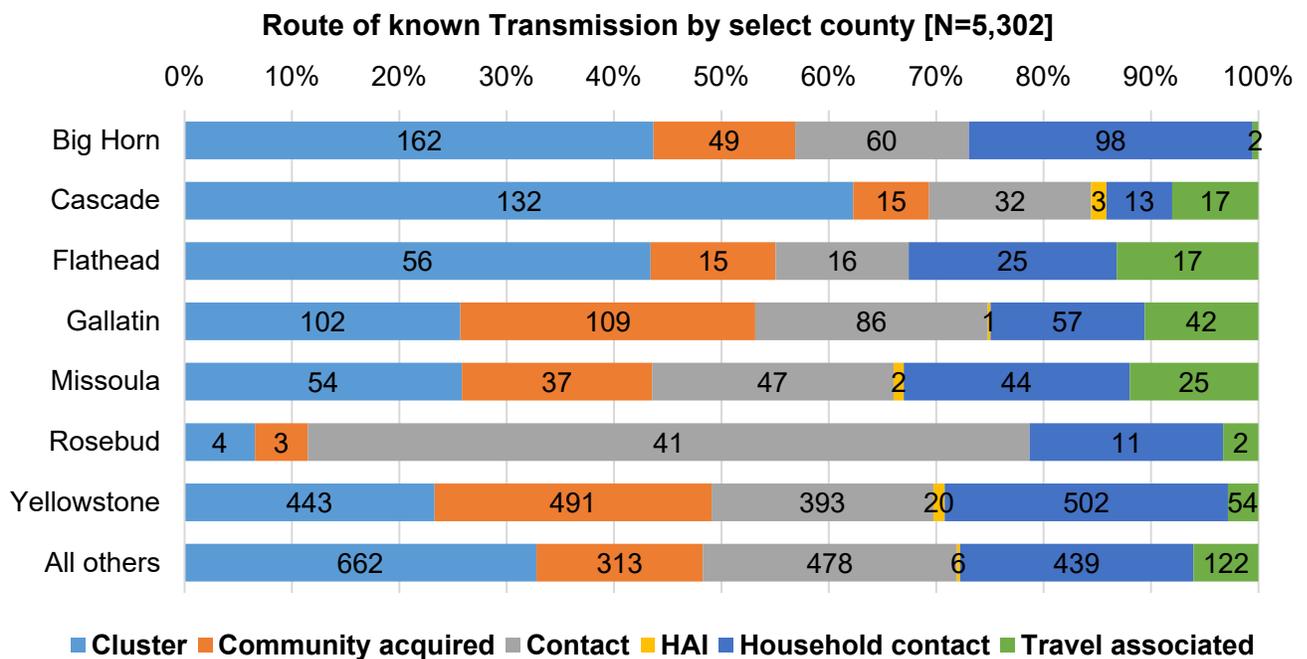

Transmission changes over time can indicate effective public health efforts, such as timely investigations, thorough contact findings, and measures to reduce community-acquired transmission. Transmission information is generally unknown for newly reported cases under investigation. Contact tracing and cluster investigations have significantly contributed to finding new cases, indicating that disease control efforts through local public health staff are identifying those infected and isolating them appropriately. New clusters were identified towards the end of May and by September they contribute to more than half of new case reports. Contacts and household contacts continue to be identified, making up one third of all cases reported in September. The percent of community-acquired cases steadily contributed to disease counts until mid-May. After that, new community-acquired cases only contributed to new COVID-19 reports periodically, with increased frequency in June and July. By mid-August, cases that were community-acquired significantly dropped. Travel-related transmission contributed to most cases early in the outbreak and then declined significantly, contributing only sporadically to new cases over time (Figure 13). Persons are more likely to acquire the virus through contact with a known case, especially within a household, or during a cluster investigation.

Figure 13: Percent of known transmission contributing to COVID-19 Montana cases

More detail about route of transmission has been analyzed for the seven counties with more than 600 reported cases. Clusters contribute to nearly two thirds of new cases in Cascade County and more than 40% of all cases in Big Horn and Flathead Counties. Contact and household contact investigations significantly impact case counts in Rosebud County. Contacts also contribute to more than 40% of new cases in Big Horn, Missoula and Yellowstone counties. Gallatin, Yellowstone and Missoula counties have most cases attributable to community-acquired transmission (27%, 26% and 18% respectively). Travel-associated transmissions account for 13% of new cases in Flathead County and about 12% of cases in Missoula County (Figure 14). Of all other counties reporting less than 600 cases, nearly half are contacts or household contacts, and one third are part of clusters. About 15% (1 out of 7) percent acquired the virus in the community and six percent were likely travel related.

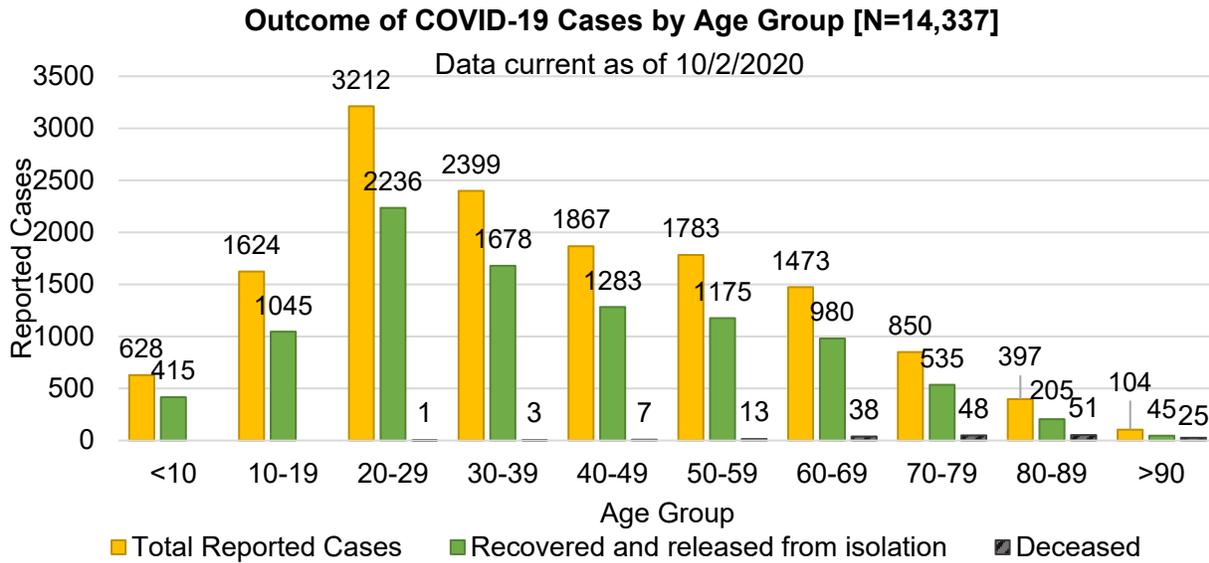

Figure 14: Breakdown of known transmission for select counties

Outcomes

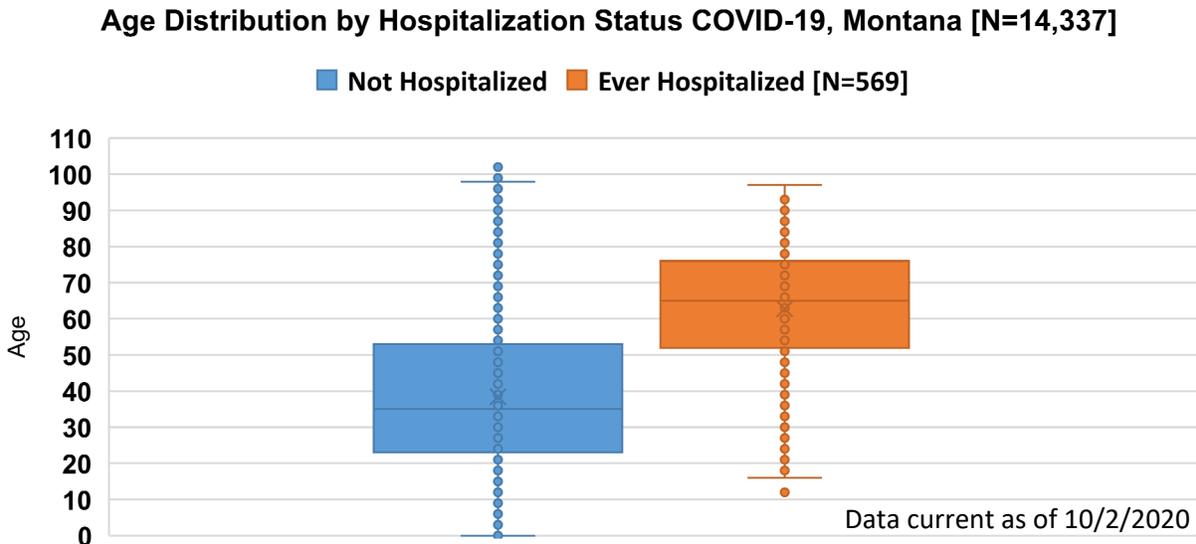

The current outcomes of COVID-19 cases in Montana depict the impact of the illness on the population. There are currently 4,554 (32%) persons actively infected and 9,597 (67%) persons who have recovered, meaning they have cleared the illness and are released from isolation (Figure 15). There are 186 persons, who were infected with COVID-19, who have died. Persons who died were between 24 and 97 years of age, with a median age of 77 years old. Fifty-five percent were male. For those who died, and race was known, 92 (63%) of them identified as white and 53 (36%) as Native American.

Figure 15: Current infections and illness outcomes for Montana COVID-19

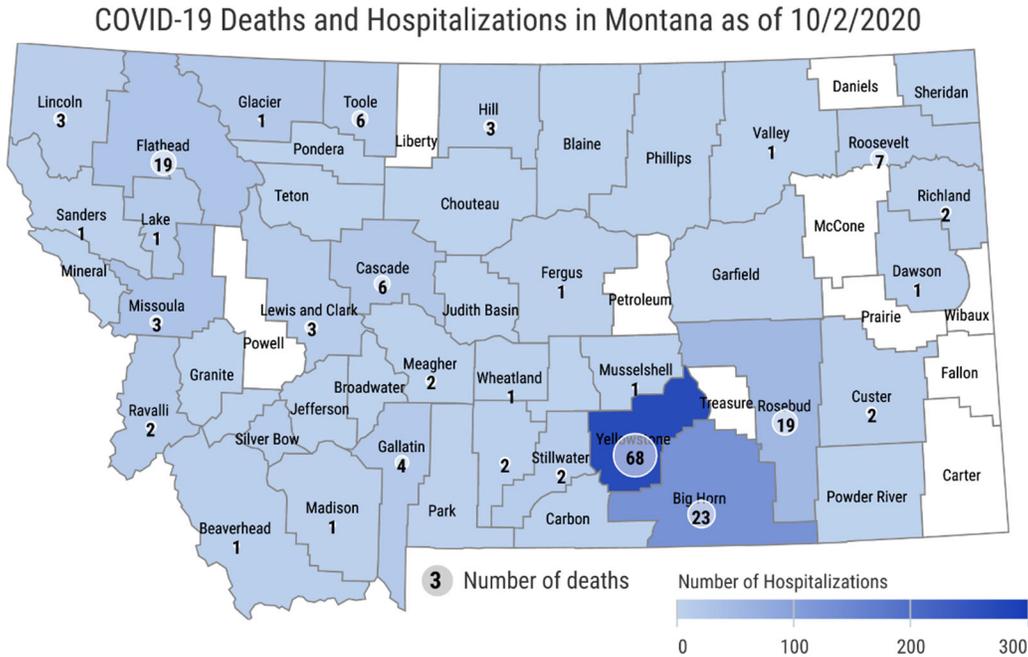

Persons who required hospitalization for COVID-19 are generally much older than those not requiring hospitalization (Figure 16). To date, 742 persons have been hospitalized with a median age of 65 years, half of them are between 52 and 76 years old. Those who did not require hospitalization have a median age of 35, and half of patients are between 23 and 53 years old. Nine percent of Native Americans and 13% of Blacks infected with COVID-19 required hospitalization versus six percent of those who identify as white and were infected with COVID-19.

Figure 16: Age Distribution among COVID-19 cases compared by known hospitalization status

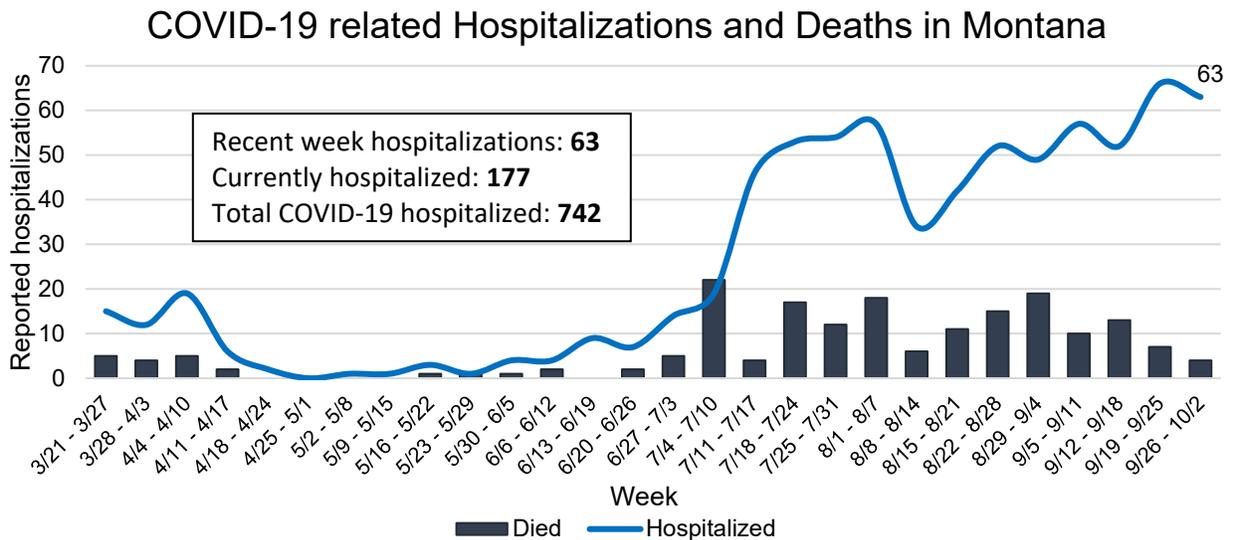

Reports of hospitalizations and deaths vary by county. Yellowstone County has reported the most cases, hospitalizations and deaths during the outbreak so far. Counties reporting ten or more deaths include Yellowstone (68), Big Horn (23), Rosebud, (19), and Flathead (19). Darker shading indicates higher number of persons hospitalized. Number of deaths reported by county are enumerated (Figure 17).

Figure 17: COVID-19 Hospitalizations and Deaths by County

As the case counts climb, more persons require hospitalization. Hospitalizations and deaths have significantly increased in mid-July and continue to rise (Figure 18). Date of death is preliminary in figure 18 and will be updated as more information becomes available.

Figure 18: Reported COVID-19 related hospitalizations and deaths over time

MONTANA COVID-19 CASES

COVID-19 Cases by Report Date -- September 5-18, 2020

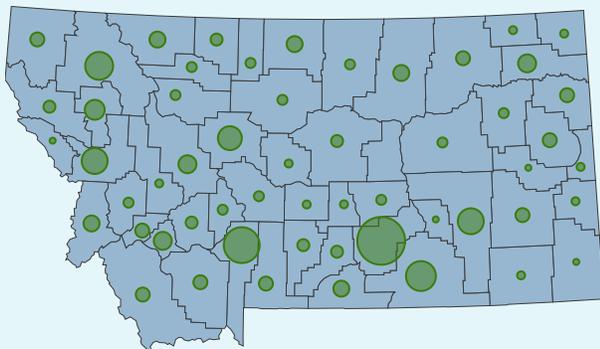

Cases: 2,012
Counties: 47
Range: 1-559

COVID-19 Cases by Report Date -- September 19 - October 2, 2020

Cases: 4,186
Counties: 54
Range: 1-770

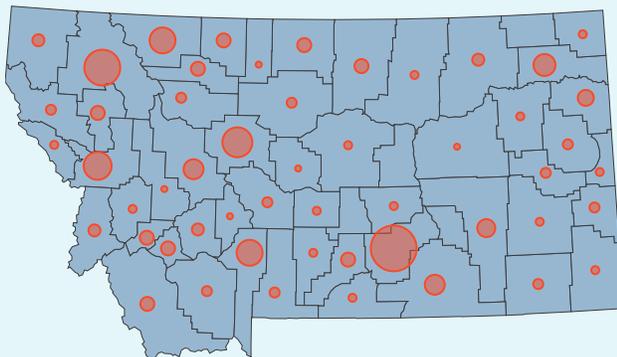

Recovered COVID-19 Cases -- Montana, October 2, 2020

Recovered: 9,648
Counties: 55
Range: 1-2,412

Recovered COVID-19 includes cases who have recovered and are released from isolation.

Active COVID-19 Cases -- Montana, October 2, 2020

Active: 4,500
Counties: 52
Range: 1-1,085

Active COVID-19 includes cases who are hospitalized or recovering but still remain in isolation.
