Why is HIV treatment important?

HIV treatment is important to achieve viral suppression, which means the amount of HIV in the body is very low or undetectable. Continuous lifetime treatment helps people with HIV to stay healthy, have improved quality of life, live longer and reduce the risk of passing HIV to others.

727 People live with HIV or AIDS in Montana

583 (80%) are receiving regular treatment to keep the virus controlled

541 (93%) of those in treatment have controlled their viral load.
