Syphilis has Increased Four-fold in Montana Compared to Recent Years

* 2018 Preliminary Cases: Montana Dept of Public Health & Human Services

- *Early symptoms of syphilis may go away but the syphilis bacteria stays in your body doing more damage.*
- *Untreated Syphilis may cause difficulty coordinating muscle movements, paralysis and dementia, permanent blindness.*
- *A pregnant woman with syphilis may transmit the infection to her unborn baby.*
- **People who are infected always need treatment.**

Risk Factors of 2018 Syphilis Cases

66% were men who have sex with men.

65% of cases with known information used social media apps and online sites to meet their partners.

HIV Six cases were co-infected with HIV.
