- Cancer mortality on the Fort Belknap Reservation was not significantly different than among white residents of the reservation counties or statewide (Figure 3).

Key facts about cancer prevention and early detection

- Less than half (47%) of Montana American Indian adults have been screened for colorectal cancer—which was lower than White Montanans and the United States average (Figure 4).
- Smoking among Montana American Indians was high (Figure 5). Smoking greatly increases a person's risk for getting at least 13 types of cancer, including lung, colorectal, and kidney.
- Obesity was also high among Montana American Indians (Figure 5). Obesity increases the risk of several types of cancer including breast, colorectal, and kidney cancers.

Reduce Your Risk for Cancer

Do not use commercial tobacco.

Get screened regularly for breast, cervical, and colorectal cancers.

Maintain a healthy weight by getting regular physical activity and eating a diet with lots of fruits and vegetables.

If you drink alcohol, do so in moderation.

†Women aged 50+ who have had a mammogram within the past two years were up to date on breast cancer screening; women aged 21-65 years who have had a pap test within the past three years were up to date on cervical cancer screening; men and women aged 50-75 who have had colonoscopy in the past 10 years, flexible sigmoidoscopy in the past 5 years, or a blood stool test in the past 1 year were up to date on colorectal cancer screening.
