

Cancer on the Fort Peck

Reservation

CANCER BURDEN FACTS

This fact sheet provides information describing the burden of cancer among American Indians living on or near the Fort Peck Reservation. American Indian residents of Daniels, Roosevelt, Sheridan, and Valley Counties were used to estimate the burden of cancer on the Fort Peck Reservation.

- 287 American Indians on the Fort Peck Reservation were diagnosed with cancer from 2012–2021. Therefore, on average there is about 29 new cases of cancer a year.
- Cancer incidence on the Fort Peck Reservation was not significantly different than among White Montanans on the Reservation counties or statewide (Figure 1).
- Five (5) kinds of cancer account for 63% of all cancers that occur on the Fort Peck Reservation (Figure 2).
- Significantly more cases of lung, colorectal, and kidney cancer were diagnosed in American Indians on the Fort Peck Reservation than would be expected if the rate were the same as White residents in the region. There were significantly fewer cases of prostate cancer than expected (Figure 2).

Updated October 2024

- 121 American Indians on the Fort Peck Reservation died because of cancer from 2012–2021. That is on average 12 deaths each year.
- Cancer mortality on the Fort Peck Reservation was greater than that among White Montanans in the Reservation counties and statewide (Figure 3).

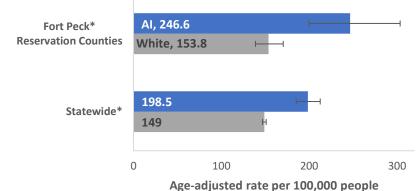

Key facts about cancer prevention and early detection

- More than half (58%) of Montana American Indian adults have been screened for colorectal cancer. This was lower than the percentage of White Montanans (Figure 4).
- Obesity was also high among Montana American Indians (Figure 5). Obesity increases the risk of several types of cancer including breast, colorectal, and kidney cancers.
- Percent of American Indian adults who report themselves as a current cigarette smoker fell from 31% in 2021 to 25% in 2023 (Figure 5). This indicates an important, positive trend, which must continue as smoking greatly increases a person's risk for getting at least 13 types of cancer, including lung, colorectal, and kidney. Smoking among Montana American Indians remains higher than in White Montanans (Figure 5).

†Women aged 50+ who have had a mammogram within the past two years were up to date on breast cancer screening; women aged 21-65 years who have had a pap test within the past three years were up to date on cervical cancer screening; men and women aged 50-75 who have had colonoscopy in the past 10 years, flexible sigmoidoscopy in the past 5 years, or a blood stool test in the past 1 year were up to date on colorectal cancer screening.

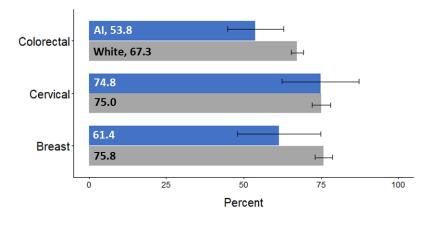

Colorectal and Breast data are from 2022, cervical cancer data is from 2020
